

# String Validators

Python has built-in string validation methods for basic data. It can check if a string is composed of alphabetical characters, alphanumeric characters, digits, etc.

## `str.isalnum()`

This method checks if all the characters of a string are alphanumeric (*a-z, A-Z and 0-9*).

```
>>> print 'ab123'.isalnum()
True
>>> print 'ab123#'.isalnum()
False
```

## `str.isalpha()`

This method checks if all the characters of a string are alphabetical (*a-z and A-Z*).

```
>>> print 'abcd'.isalpha()
True
>>> print 'abcd1'.isalpha()
False
```

## `str.isdigit()`

This method checks if all the characters of a string are digits (*0-9*).

```
>>> print '1234'.isdigit()
True
>>> print '123edsd'.isdigit()
False
```

## `str.islower()`

This method checks if all the characters of a string are lowercase characters (*a-z*).

```
>>> print 'abcd123#'.islower()
True
>>> print 'Abcd123#'.islower()
False
```

## `str.isupper()`

This method checks if all the characters of a string are uppercase characters (*A-Z*).

```
>>> print 'ABCD123#'.isupper()
True
>>> print 'Abcd123#'.isupper()
False
```

## Task

You are given a string *S*.

Your task is to find out if the string *S* contains: *alphanumeric characters, alphabetical characters, digits, lowercase and uppercase characters*.

## Input Format

A single line containing a string  $S$ .

### Constraints

$$0 < \text{len}(S) < 1000$$

### Output Format

In the first line, print **True** if  $S$  has any *alphanumeric characters*. Otherwise, print **False**.

In the second line, print **True** if  $S$  has any *alphabetical characters*. Otherwise, print **False**.

In the third line, print **True** if  $S$  has any *digits*. Otherwise, print **False**.

In the fourth line, print **True** if  $S$  has any *lowercase characters*. Otherwise, print **False**.

In the fifth line, print **True** if  $S$  has any *uppercase characters*. Otherwise, print **False**.

### Sample Input

```
qA2
```

### Sample Output

```
True
True
True
True
True
```
